Fundamentals of Medicinal and Pharmaceutical Chemistry

FUNCHEM.28 Driving Forces Behind Chemical & Biological Reactions

Professor Dan Wu

DATE: 20th December 2024

Factors Controlling Biological Phenomena

Factors affecting reaction rates

Rate law and orders of reactions

Molecularities of reactions

Pharmacokinetics

Catalysis and enzymes

Driving forces behind chemical & biological reactions

Importance of free energy in biochemical processes

Learning Objectives

- Driving forces behind chemical & biological reactions.
- Define the term 'thermodynamics'.
- Explain what you understand by an exothermic and endothermic process with the aid of energy profile diagrams.
- Explain the principles behind 'hot packs' used to treat muscular and arthritic pain and 'cold packs' used to treat sprains and swellings.
- Recall what you understand by 'standard conditions'.
- Define 'standard enthalpy of formation', 'standard enthalpy of combustion' and 'standard enthalpy of reaction'.
- State units of enthalpy.
- Recall the first law of thermodynamics.
- Recall standard rules for manipulating thermochemical equations.
- Recall and apply Hess's Law to work out the standard enthalpy change for a specified reaction.

Consider a chemical equation . . .

- Does not help you predict whether the reaction is likely to occur
- Thermodynamics: Tool used to predict whether a reaction is spontaneous or not

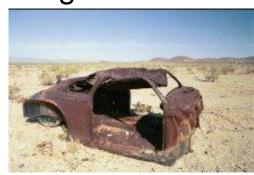

Spontaneous reactions: occur of their own accord

e.g. Cars rust

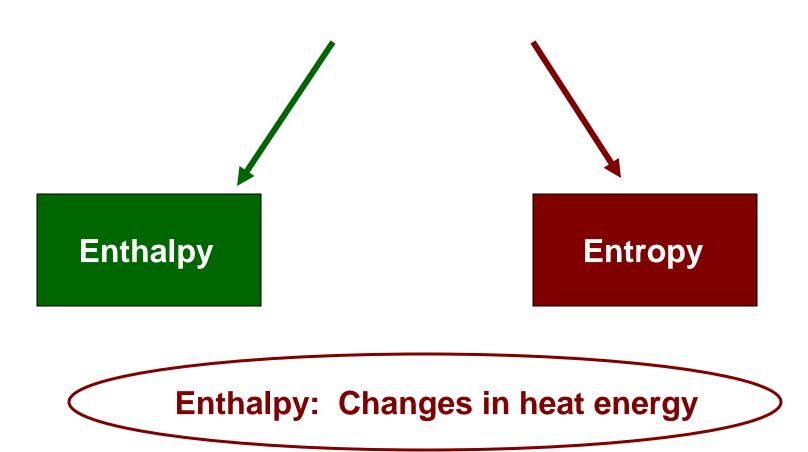

e.g. Waterfall

Thermodynamics The driving force behind chemical and biological reactions.

Most reactions (chemical or biological) occur with changes in energy

A reactant B product

- Cannot measure the energy of A directly (E₁)
- > Cannot measure the energy of B directly (E2)
- Can measure the energy change which occurs during the reaction

$$\Delta E = E_2 - E_1$$

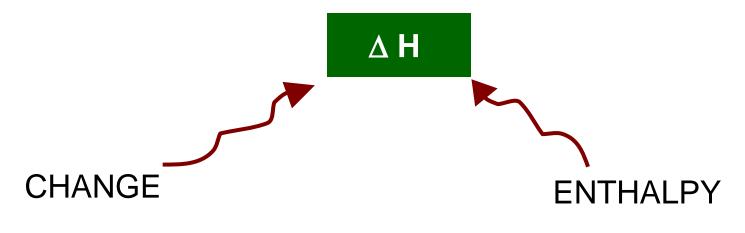

DELTA (Δ)
= CHANGE product reactants

Because the energy involved is heat:

Instead of energy = E

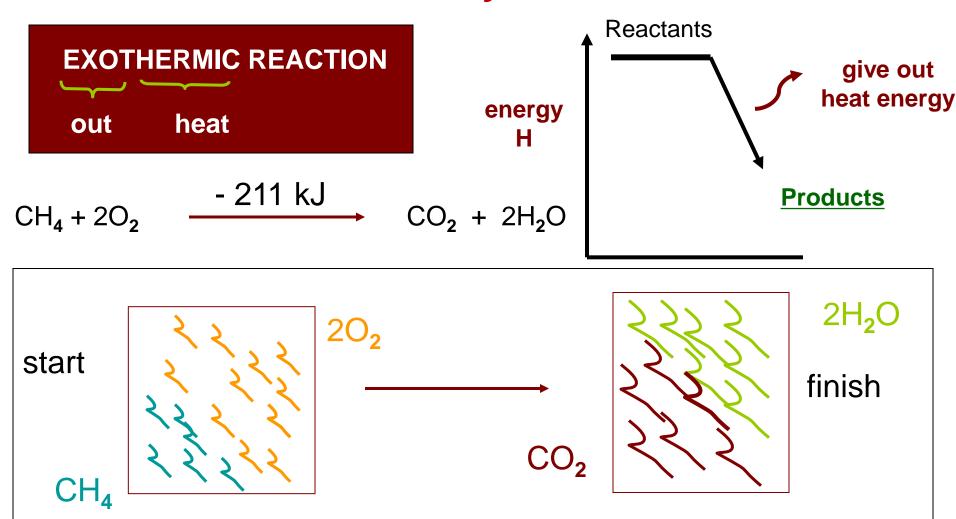

We use

Enthalpy = H

Units = kJ mol⁻¹

kJ of energy per mole of reactant

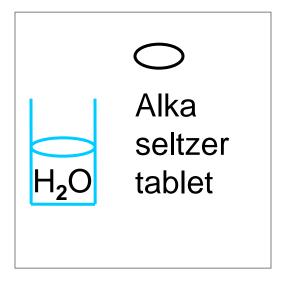

Surroundings at room temperature

Surroundings gain heat

ENDOTHERMIC REACTION: Heat taken in

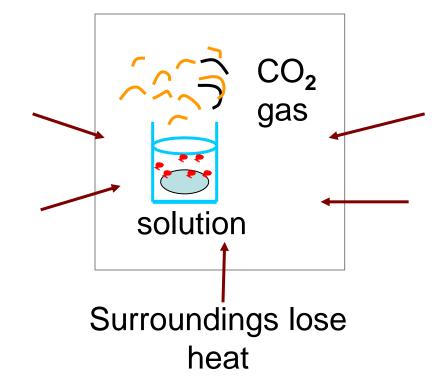

in heat

start

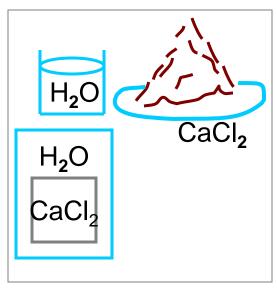

Surroundings at room temperature

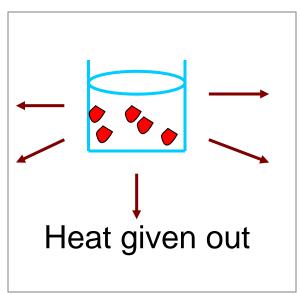

finish

Hot Pack – used to treat muscle and arthritic pain

40g CaCl₂ in 100 ml H₂O

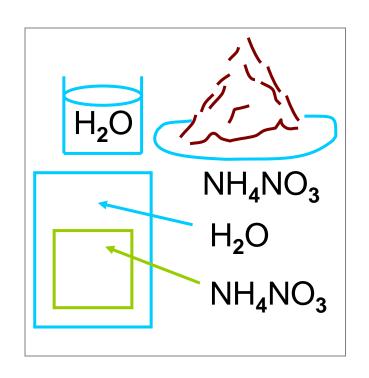

20°C room temperature

90 °C

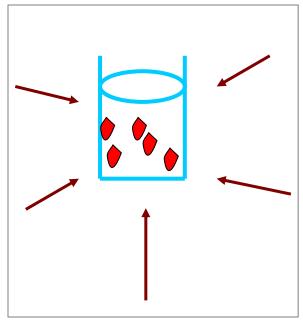

surroundings

Cold Pack – used to treat sprains & swellings

Heat taken in from surroundings

ENDOTHERMIC

Standard Enthalpy Change

Calorimetry - technique used to measure the heat energy which accompanies a reaction

STANDARD ENTHALPY CHANGE:

Enthalpy change which occurs at temp **298K** and **1 atm** pressure

change Δ H ° Standard Temp = 298 K enthalpy Pressure = 1 atm

Standard Enthalpy Change

Standard Enthalpy Change of *Formation* ΔH°_{f} Standard Enthalpy Change of *Combustion* ΔH°_{c}

Standard Enthalpy of *Reaction* △ H°_{rxn}

Standard Enthalpy Change of *Formation* ΔH°_{f}

$$\Delta \, \mathsf{H}^{\mathsf{o}}_{\mathbf{f}}$$

Enthalpy change that occurs when 1 mole of compound is formed from its uncombined elements at STANDARD temp. = 298 K; pressure 1 atm

$$C_{(s)} + O_{2(g)} \rightarrow CO_{2(g)} \Delta H^{\circ}_{f} = -393.5 \text{ kJ mol}^{-1}$$
 $CO_{(g)} + \frac{1}{2}O_{2(g)} \rightarrow CO_{2(g)}$
Not uncombined

element

Standard Enthalpy Change of Combustion ΔH°_{c}

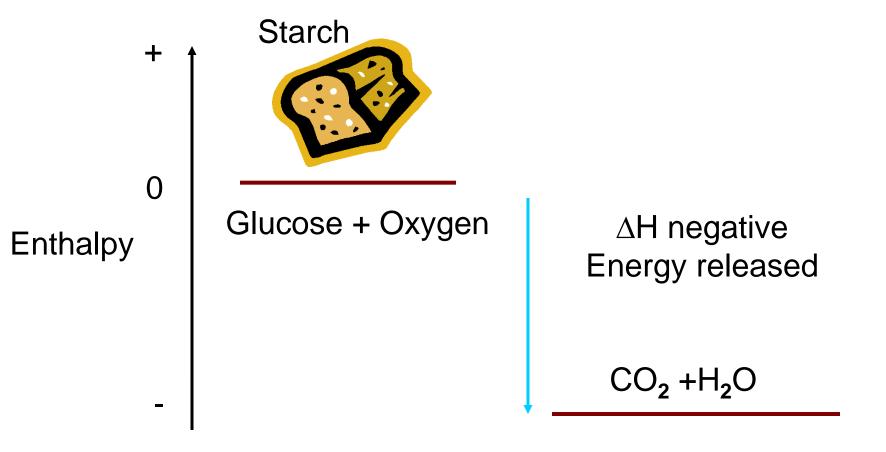

Enthalpy change that occurs when 1 mole of an element or compound is burned in excess O_2 at 298k + 1 atm.

Example:

$$C_6H_{12}O_6 + xs O_2 \longrightarrow 6CO_2 + 6H_2O$$

$$\Delta H_c^{\circ} = -2801 \text{ kJ mol}^{-1}$$

Metabolism

Combustion is always **highly exothermic**. Think of fires, gas cookers etc. - Δ H

Standard Enthalpy of *Reaction* ΔH°_{rxn}

More general term:

$$C + O_2 \xrightarrow{\Delta H^{\circ}?} CO_2$$

 ΔH_c° : standard enthalpy of **combustion** of C

 ΔH_{f}° : standard enthalpy of **formation** of CO_{2}

 ΔH°_{rxn} : standard enthalpy of reaction of C + O₂

Standard Enthalpy of Reaction

A D

reactants product

$$\Delta H = H_{products} - H_{reactants}$$

How do you measure ∆H directly?

FIRST LAW OF THERMODYNAMICS

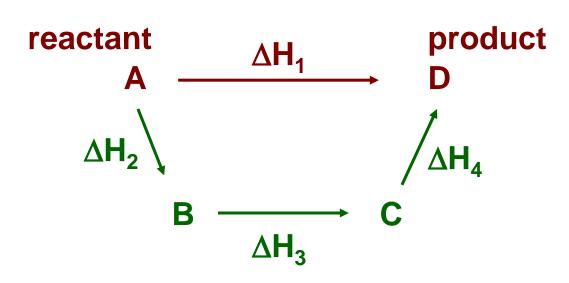

Energy cannot be created nor destroyed, it can only be converted from one form to another

Standard Enthalpy of Reaction

HESS'S LAW:

The enthalpy change of a reaction is the same regardless of the pathway by which the reaction occurs.

Hess's Cycle

$$\Delta H_1 = \Delta H_2 + \Delta H_3 + \Delta H_4$$

Standard Enthalpy of Reaction

A
$$\Delta H^{\circ}_{rxn} = ?$$
 D
$$\Delta H^{\circ}_{rxn} = 4$$

$$\Delta H^{\circ}_{rxn} = 8$$

$$\Delta H^{\circ}_{rxn} = -6$$

A
$$\rightarrow$$
 B = $\Delta H^{\circ}_{rxn} = +4$
B = $\Delta H^{\circ}_{rxn} = -6$
C = $\Delta H^{\circ}_{rxn} = +8$
A \rightarrow D $\Delta H^{\circ}_{rxn} = +6$

- 1. Must have balanced equations
- 2. Must specify states of the reactants and products i.e. solids/liquids/gases/aqueous

$$2H_{2(g)} + O_{2(g)}$$
 \longrightarrow $2H_2O_{(g)}$ $\Delta H = -477 \text{ kJmol}^{-1}$

$$2H_{2(g)} + O_{2(g)}$$
 \longrightarrow $2H_2O_{(I)}$ $\Delta H = -571 \text{kJmol}^{-1}$

3. Reverse Reaction: Reverse Sign

Ice forming

$$H_2O_{(I)} \longrightarrow H_2O_{(s)}$$

$$\Delta H = -6.01 \text{kJmol}^{-1}$$

Ice melting

$$H_2O_{(s)} \longrightarrow H_2O_{(l)}$$

$$\Delta H = + 6.01 \text{kJmol}^{-1}$$

4. $\triangle H$ depends on the amount reacting

Ice forming

$$H_2O_{(I)}$$
 \longrightarrow $H_2O_{(s)}$

$$\Delta H = -6.01 \text{kJmol}^{-1}$$

$$2H_2O_{(I)}$$
 \longrightarrow $2H_2O_{(s)}$

$$\Delta H = -12.02 \text{ kJ}$$

$$0.5 \text{ H}_2\text{O}_{(I)} \longrightarrow 0.5 \text{ H}_2\text{O}_{(s)}$$

$$\Delta H = -3.005 \text{ kJ}$$

5. Enthalpy of formation of an element in its most stable form

$$\Delta H_{f}^{o} O_{2} = O$$

$$\Delta H_f^o H_2 = O$$

$$\Delta H_f^o$$
 Na = O

Determine ΔH_{rxn} - Draw a Hess Cycle

1. Write out the equation you require and balance it.

e.g.
$$A + B \longrightarrow AB_2$$

$$A + 2B \longrightarrow AB_2$$

- 2. Write equations to represent information given
- 3. Aim to find a sequence of reactions, the sum of which is the reaction of interest
- 4. Solve

Determine the molar heat of combustion of methanol.

Given:

$$\Delta H_{f}^{o}$$
 (CO₂)_(q) = -393.5 kJ mol⁻¹

$$\Delta H_{f}^{o}$$
 (H₂O)_(g) = -241.8 kJ mol⁻¹

$$\Delta H_{f}^{o}$$
 (CH₃OH)_(g) = -239.0 kJ mol⁻¹

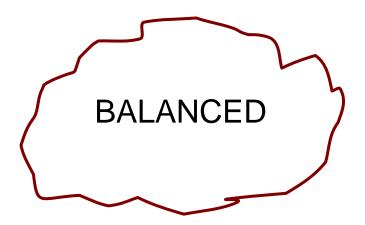

Molar heat of combustion of methanol

$$\Delta H_{c}^{\circ}$$
 (CH₃OH)

Step 1: Write out equation you require and balance it

$$CH_3OH_{(I)} + 1.5 O_{2(g)} \longrightarrow CO_{2(g)} + 2 H_2O_{(g)}$$

Step 2: Write out equations for information given

$$\Delta H^0_f$$
 (CO₂) (g) C_(s) + O_{2(g)} \longrightarrow CO_{2(g)}

$$\Delta H^0_f = -393.5 \text{ kJ mol}^{-1}$$

$$\Delta H^0_f (H_2O) (g) \qquad H_{2(g)} + 0.5 O_{2(g)} \longrightarrow H_2O_{(g)}$$

$$\Delta H^0_f = -241.8 \text{ kJ mol}^{-1}$$

$$\Delta H^0_f (CH_3OH) (I)$$

$$C_{(s)} + 2H_{2(g)} + 0.5 O_{2(g)} \longrightarrow CH_3OH$$

$$\Delta H^0_f = -239 \text{ kJ mol}^{-1}$$

Step 3:

Aim to find a sequence of reactions, the sum of which is the reaction of interest:

Equation required:

$$CH_3OH_{(I)} + 1.5 O_{2(g)} \xrightarrow{\Delta H_c^{\circ}} CO_{2(g)} + 2H_2O_{(g)}$$

Given:

$$C_{(s)} + O_{2(g)} \longrightarrow CO_{2(g)}$$
 $\Delta H^{o}_{f} = -393.5 \text{ kJ mol}^{-1}$
 $H_{2(g)} + 0.5 O_{2(g)} \longrightarrow H_{2}O_{(g)}$ $\Delta H^{o}_{f} = -241.8 \text{ kJ mol}^{-1}$

$$C_{(s)} + 2 H_{2(g)} + 0.5 O_{2(g)} \longrightarrow CH_3OH \Delta H_f^o = -239 \text{ kJ mol}^{-1}$$

Recall: $\Delta H_f^{\circ}(O_2)$

Enthalpy of formation of element in natural form = 0

Step 3: Rearrange reactions to give the reaction of interest:

Equation required:

$$CH_3OH_{(I)} + 1.5 O_{2(g)} \xrightarrow{\Delta H_c^{\circ}} CO_{2(g)} + 2H_2O_{(g)}$$

Given:

$$C_{(s)} + O_{2(g)} \longrightarrow CO_{2(g)} \Delta H_f^o = -393.5 \text{ kJ mol}^{-1}$$

$$H_{2(g)} + 0.5 O_{2(g)} \longrightarrow H_2O_{(g)} \Delta H_f^o = -241.8 \text{ kJ mol}^{-1} \times 2$$

$$C_{(s)} + 2 H_{2(g)} + 0.5 O_{2(g)} \longrightarrow CH_3OH \Delta H_f^o = -239 \text{ kJ mol}^{-1}$$

Step 3: Rearrange reactions to give the reaction of interest:

Equation required:

$$CH_3OH_{(I)} + 1.5 O_{2(g)} \xrightarrow{\Delta H_c^{\circ}} CO_{2(g)} + 2H_2O_{(g)}$$

Rearranged:

$$C_{(s)} + O_{2(g)} \longrightarrow CO_{2(g)} \Delta H^{o} = -393.5 \text{ kJ mol}^{-1}$$

$$2 H_{2(s)} + O_{2(g)} \longrightarrow 2 H_2O_{(g)} \Delta H^o = -483.6 \text{ kJ mol}^{-1}$$

CH₃OH
$$\longrightarrow$$
 C_(s) + 2 H_{2(g)} + 0.5 O_{2 (g)} \triangle H° = + 239 kJ mol⁻¹

Does it balance?

$$C_{(g)} + O_{2(g)} \longrightarrow CO_{2(g)}$$

$$\Delta H_{f}^{o} = -393.5 \text{ kJ mol}^{-1}$$

$$2 H_{2(g)} + O_{2(g)} \longrightarrow 2 H_2O_{(g)} \qquad \Delta H^o = -483.6 \text{ kJ mol}^{-1}$$

$$\Delta H^{\circ} = -483.6 \text{ kJ mol}^{-1}$$

CH₃OH
$$\longrightarrow$$
 C₍₃₎ + 2 H_{2(g)} + 0.5 Q_{2 (g)} Δ H° = + 239 kJ mol⁻¹

$$\Delta H^{o} = + 239 \text{ kJ mol}^{-1}$$

$$CH_3OH_{(I)} + 1.5 O_2(g) \longrightarrow CO_{2(g)} + 2H_2O_{(I)}$$

$$\Delta H_{c}^{\circ} = -393.5 - 483.6 + 239 = -638.1 \text{ kJ mol}^{-1}$$

Try this one: Calculate ΔH_{rxn}^0 for

$$C_6H_{6(I)} + {}^{15}/_2 O_{2(g)} \longrightarrow 6 CO_{2(g)} + 3 H_2O_{(I)}$$

Given:

$$\Delta H_{f}^{0}$$
 $CO_{2} = -393.5 \text{ kJ mol}^{-1}$
 $H_{2}O = -285.8 \text{ kJ mol}^{-1}$
 $C_{6}H_{6(I)} = +49.0 \text{ kJ mol}^{-1}$

Learning Objectives

- Driving forces behind chemical & biological reactions.
- Define the term 'thermodynamics'.
- Explain what you understand by an exothermic and endothermic process with the aid of energy profile diagrams.
- Explain the principles behind 'hot packs' used to treat muscular and arthritic pain and 'cold packs' used to treat sprains and swellings.
- Recall what you understand by 'standard conditions'.
- Define 'standard enthalpy of formation', 'standard enthalpy of combustion' and 'standard enthalpy of reaction'.
- State units of enthalpy.
- Recall the first law of thermodynamics.
- Recall standard rules for manipulating thermochemical equations.
- Recall and apply Hess's Law to work out the standard enthalpy change for a specified reaction.
